## Rapport Ndeye Bana L3-GLSIA

## Installation

On va utiliser Angular pour la mise en place de notre site

Avant tout on va installer Node.js et npm

```
Administrateur : Invite de commandes
Microsoft Windows [version 10.0.19045.5371]
(c) Microsoft Corporation. Tous droits réservés.
C:\WINDOWS\system32>node --version
v23.7.0
C:\WINDOWS\system32>npm -- version
 npm: '11.1.0',
 node: '23.7.0',
 acorn: '8.14.0',
 ada: '2.9.2',
 amaro: '0.3.0',
 ares: '1.34.4',
 brotli: '1.1.0',
  cjs module lexer: '1.4.1',
 cldr: '46.0',
 icu: '76.1',
 llhttp: '9.2.1',
 modules: '131',
 napi: '10',
 nbytes: '0.1.1',
```

Nous pouvons maintenant passer à l'installation de Angular

```
npm install -g @angular/cli
```

```
ng new parrainage-app
cd parrainage-app
```

```
Which stylesheet format would you like to use? CSS [https://developer.mozilla.org/docs/Web/CSS
Do you want to enable Server-Side Rendering (SSR) and Static Site Generation (SSG/Prerendering)? No

```

Saissons cette commande pour générer le composant nommé registration

```
ng generate component registration
```

Apres cela on saisit code . qui va nous rediriger dans une autre fenêtre vscode avec toutes les informations reliées à cet composant

Passons à la modification du fichier registration.component.html

On a utiliser css pour embellir le site et un peu de javascript

```
{} angular.json M
                                                                                  registration.compone 🕻
parrainage-app > src > app > registration > 💠 registration.component.html > 🤣 html > 🤣 head > 🤣 style > 😭 label
      <html lang="en">
          button:hover {
            background-color: ■#0056b3;
        </style>
      </head>
         <form (ngSubmit)="onSubmit()" #registrationForm="ngForm">
             <label for="electorNumber">Numéro de carte d'électeur</label>
             <input type="text" id="electorNumber" required [(ngModel)]="elector.electorNumber" nam</pre>
           </div>
             <label for="idNumber">Numéro de carte d'identité nationale
             <input type="text" id="idNumber" required [(ngModel)]="elector.idNumber" name="idNumber"</pre>
           </div>
             <label for="lastName">Nom de famille</label>
             <input type="text" id="lastName" required [(ngModel)]="elector.lastName" name="lastNam</pre>
           </div>
```

## Passons à la modification du fichier registration.component.ts

```
TS registration.component.ts U X {} angular.json M
parrainage-app > src > app > registration > TS registration.component.ts > 😭 RegistrationComponent > 🔑 elector
       import { Component } from '@angular/core';
      @Component({
         selector: 'app-registration',
         templateUrl: './registration.component.html',
         styleUrls: ['./registration.component.css']
       export class RegistrationComponent {
        elector = {
           electorNumber: '',
          idNumber: '',
          lastName: '',
           pollingStation: '',
         onSubmit() {
          if (this.validateForm()) {
            console.log('Formulaire soumis', this.elector);
             console.log('Formulaire invalide');
```

Ajoutons <app-registration></app-registration> dans app.component.html

## Resultat
